IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

- 1.-13. (canceled)
- 14. (original) A silicon-on-insulator structure comprising:
 - a body layer comprising source, drain, and channel regions, the channel region being positioned between the source and drain regions;
 - a highly-doped substrate layer, the highly-doped substrate layer being doped to a first doping polarity;

an insulator layer between the body layer and the highly-doped substrate layer;
wherein the highly-doped substrate layer comprises two compensated regions adjacent
the insulator layer and aligned with the source and drain regions, and an
uncompensated region between the two compensated regions aligned with the
channel region, the compensated regions being further doped with dopants of
a second polarity opposite the first polarity.

- 15. (original) The silicon-on-insulator structure of claim 14 wherein the source and drain regions are doped to a second doping polarity.
- 16. (original) The silicon-on-insulator structure of claim 15 wherein the channel region is doped to the first doping polarity.
- 17. (original) The silicon-on-insulator structure of claim 14 wherein the compensated regions are doped with dopants of a second polarity to a concentration substantially -3-

Serial No.: 10/806,609

equivalent to the concentration of the first doping polarity of the uncompensated region.

- 18. (original) The silicon-on-insulator structure of claim 14 further comprising a masking structure to substantially shield the channel region from implantation of dopants of a second polarity into the compensated regions.
- 19. (original) The silicon-on-insulator structure of claim 18 wherein the masking structure comprises a gate.
- 20. (original) The silicon-on-insulator structure of claim 16 wherein the second polarity is an N-type polarity and the first polarity is a P-type polarity, forming a NMOS structure.
- 21. (original) The silicon-on-insulator structure of claim 16 wherein the second polarity is an P-type polarity and the first polarity is a N-type polarity, forming a PMOS structure.
- 22. (original) The silicon-on-insulator structure of claim 16 wherein the thin substrate layer and highly-doped substrate layer comprise silicon, and wherein the insulator layer comprises silicon dioxide.
- 23. (original) The method of claim 22 wherein the body layer and insulator layer both have a thickness of about 100 angstroms, the uncompensated and channel region are doped

 4-

Serial No.: 10/806,609 Attorney Docket: P14691D

to a first doping polarity at a concentration of about $1x10^{19}$ first dopant atoms per cubic centimeter, the source and drain regions are doped to a second doping polarity at a concentration of about $1x10^{21}$ second dopant atoms per cubic centimeter, and wherein the compensated regions are doped to a second doping polarity at a concentration of about $1x10^{19}$ second dopant atoms per cubic centimeter.

- 24. (original) The method of claim 23 wherein the first dopant atoms are boron atoms, and wherein the second dopant atoms are selected from the group consisting of arsenic and phosphorus atoms.
- 25. (original) The method of claim 23 wherein the second dopant atoms are boron atoms, and wherein the first dopant atoms are selected from the group consisting of arsenic and phosphorus atoms.

Respectfully submitted,

Date: 8/2/05

Michael D. Plimier
